THE PROBLEM OF ZOMBIE SOFTWARE

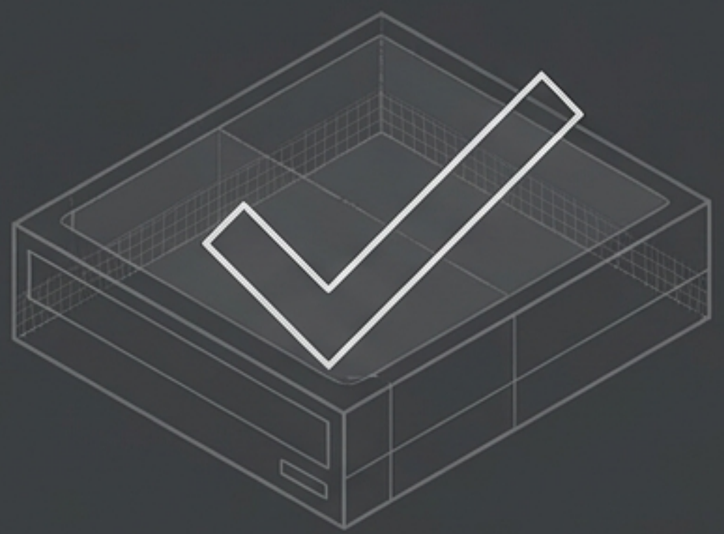

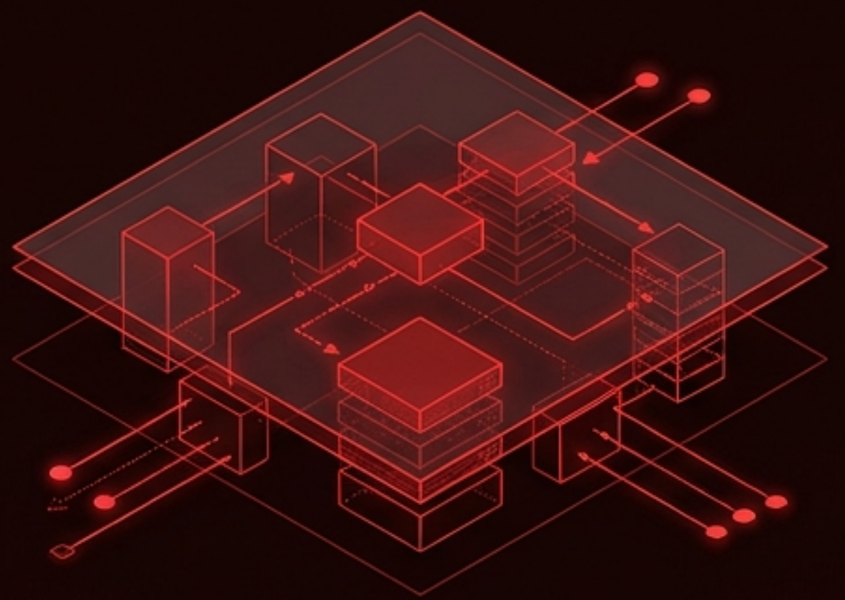

UNMASKING THE CONTINUOUS THREAT OF DE-COUPLED RESURRECTION ARCHITECTURES

Modern software deployments, notably background utilities (AGS, AdobeGCClient, OOBE), utilize persistent zombie architectures. These privileged daemons continuously monitor system state, scanning both hardware IDs and memory namespaces to report telemetry without explicit user consent.

Gemini Notebook

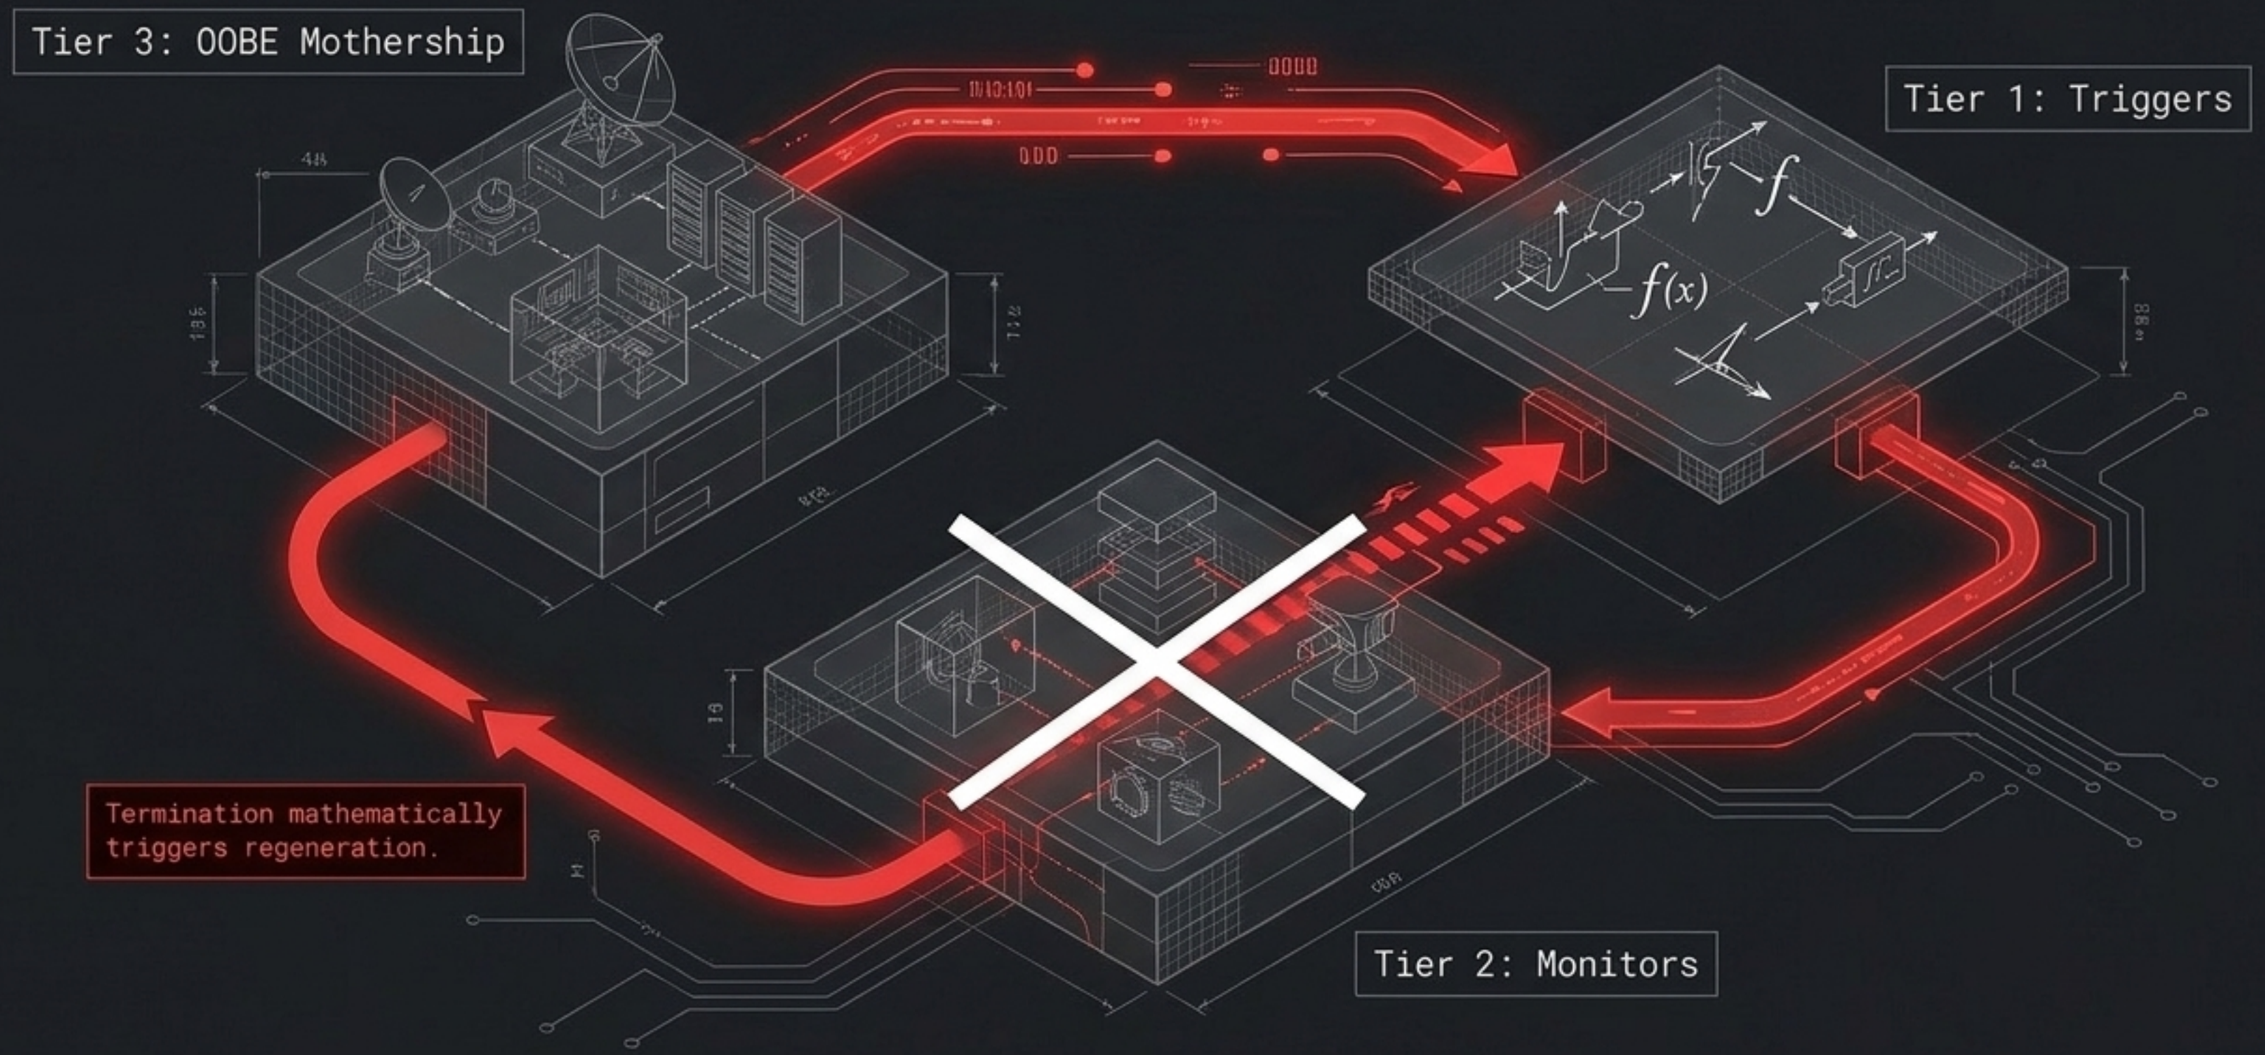

THE ILLUSION OF STANDARD UNINSTALLATION

EXPECTED STATE (STANDARD UNINSTALL)	ACTUAL STATE (ZOMBIE ARCHITECTURE)
User Action: Clicks Uninstall via OS Control Panel	Actual Result: The persistence ecosystem remains completely intact.
Expected Result: Clean System. Software footprint eradicated.	Remnants: Orphaned data caches, dangling registry keys, and hidden background daemons operating with system-level privileges.
	

Gemini Notebook

THE DE-COUPLED RESURRECTION ARCHITECTURE

Persistence is not a single executable; it is a 3-tier resilience loop designed for continuous regeneration.

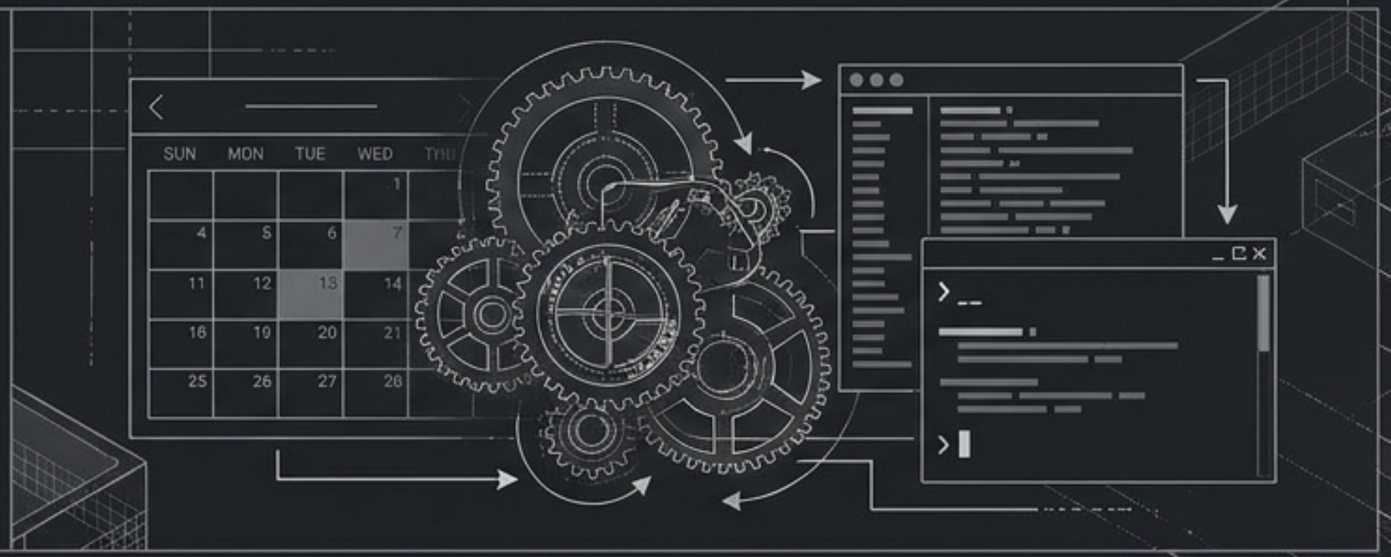

Gemini Notebook

TRIGGERS & MONITORS: THE FIRST LINE OF PERSISTENCE

TIER 1: TRIGGERS

Scheduled Tasks & LaunchDaemons. Hidden timers trigger at logon and hourly intervals.

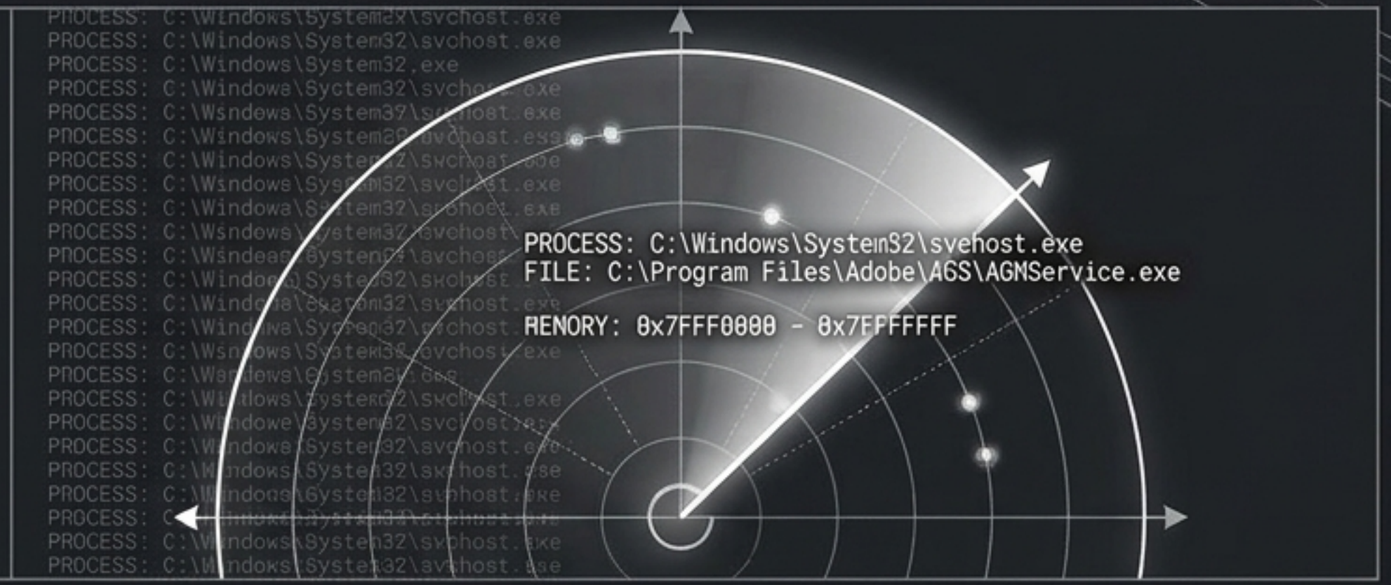

```
Adobe-Genuine-Software-Integrity-Scheduler |
AdobeGCInvoker |
com.adobe.agsservice.plist
```

TIER 2: MONITORS

System-Level Privileged Daemons. Binaries monitor memory, process namespaces, and open file descriptors, beaconing telemetry back to vendor servers.

```
AGMService.exe | AGSService.exe
```

Gemini Notebook

TIER 3: THE OOBE MOTHERSHIP

Deleting the monitor does not kill the software; it activates the re-deployment sequence.

USER ACTION

AGMService.exe

User forcefully deletes AGMService.exe (Tier 2)

THE TRIGGER

Tier 1 hourly trigger detects the missing binary

THE MOTHERSHIP

Secondary updater utilities are activated (PDapp.exe, agcinvokerutility.exe)

THE RESURRECTION

Fresh payload is dropped back onto the disk, restoring exact state

Gemini Notebook

NukeAdobe: The 6-Phase Eradication Engine

A lightweight, cross-platform (Windows & macOS), zero-dependency uninstaller designed to systematically dismantle the resurrection loop.

Gemini Notebook

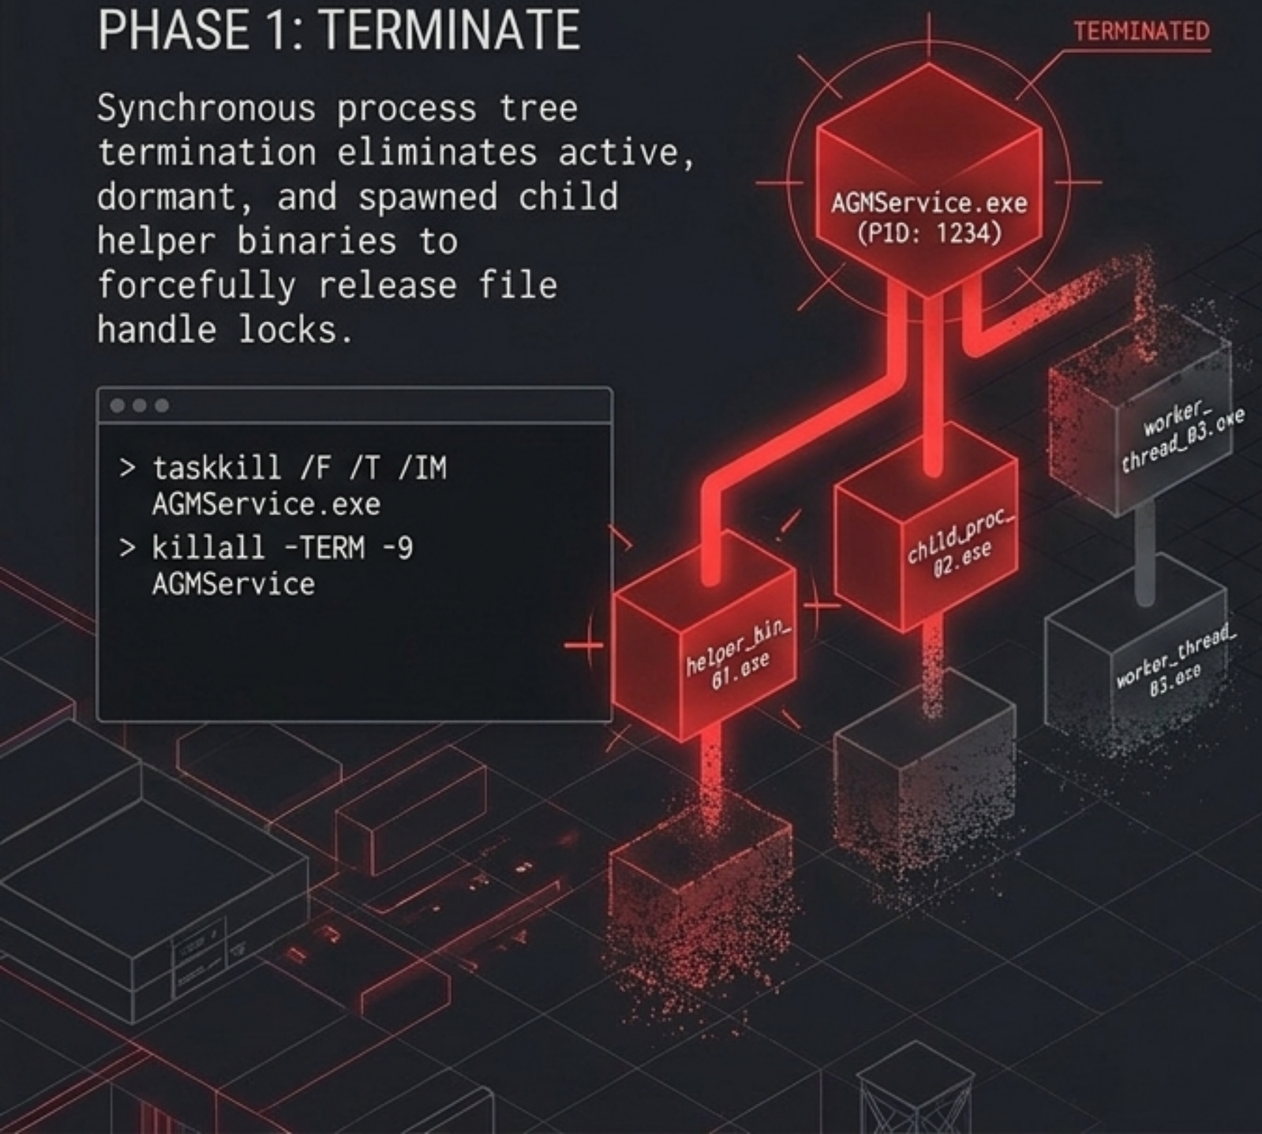

PHASES 1 & 2: TERMINATE & DEREGISTER

Synchronous process termination and low-level service deregistration.

PHASE 1: TERMINATE

Synchronous process tree termination eliminates active, dormant, and spawned child helper binaries to forcefully release file handle locks.

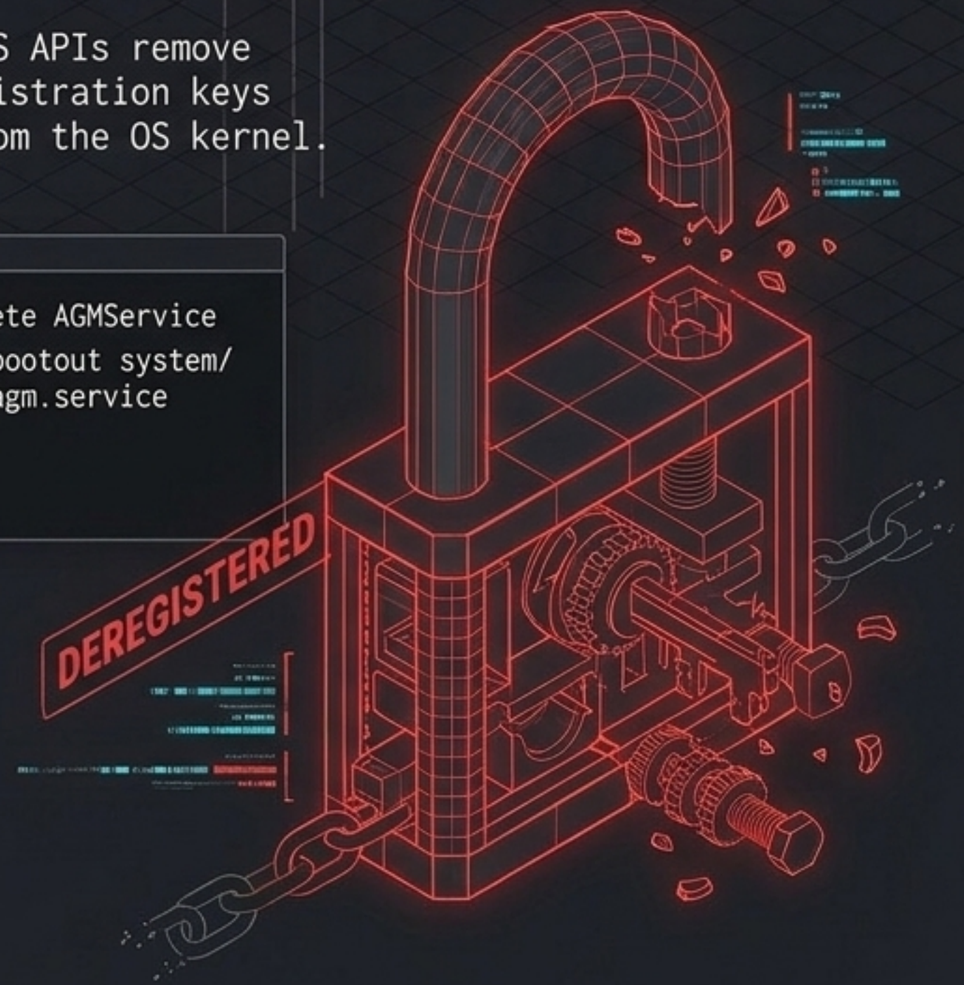

```
> taskkill /F /T /IM AGMService.exe
> killall -TERM -9 AGMService
```

PHASE 2: DEREGISTER

Low-level OS APIs remove service registration keys directly from the OS kernel.

```
> sc.exe delete AGMService
> launchctl bootout system/com.adobe.agm.service
```

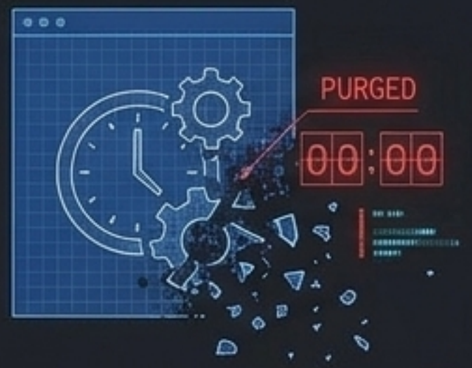

Gemini Notebook

Phases 3 & 4: Purge & Scrub

Synchronized scheduled task wipe and recursive filesystem hygiene.

Phase 3: Purge

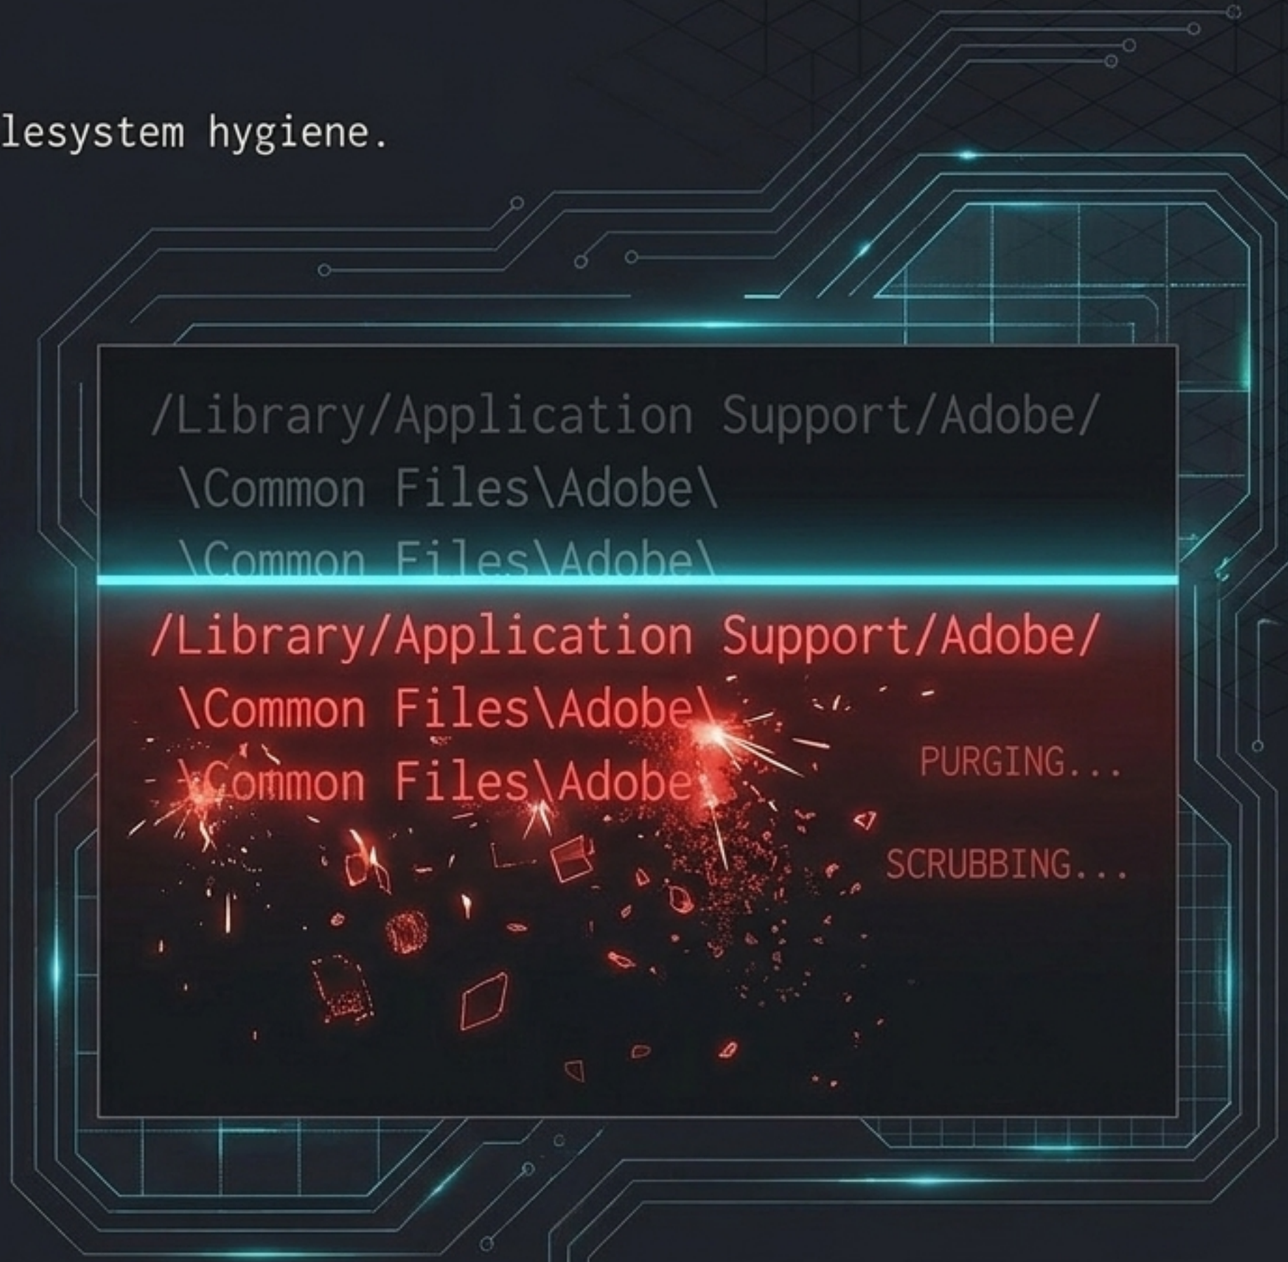

Wipes all scheduled triggers matching the vendor namespace (schtasks), permanently destroying the resurrection countdown.

Phase 4: Scrub

Recursively purges orphaned application data caches, logs, and staging payloads from both system and user directories.

Gemini Notebook

“Eradication removes the software. Immunization removes the possibility.”

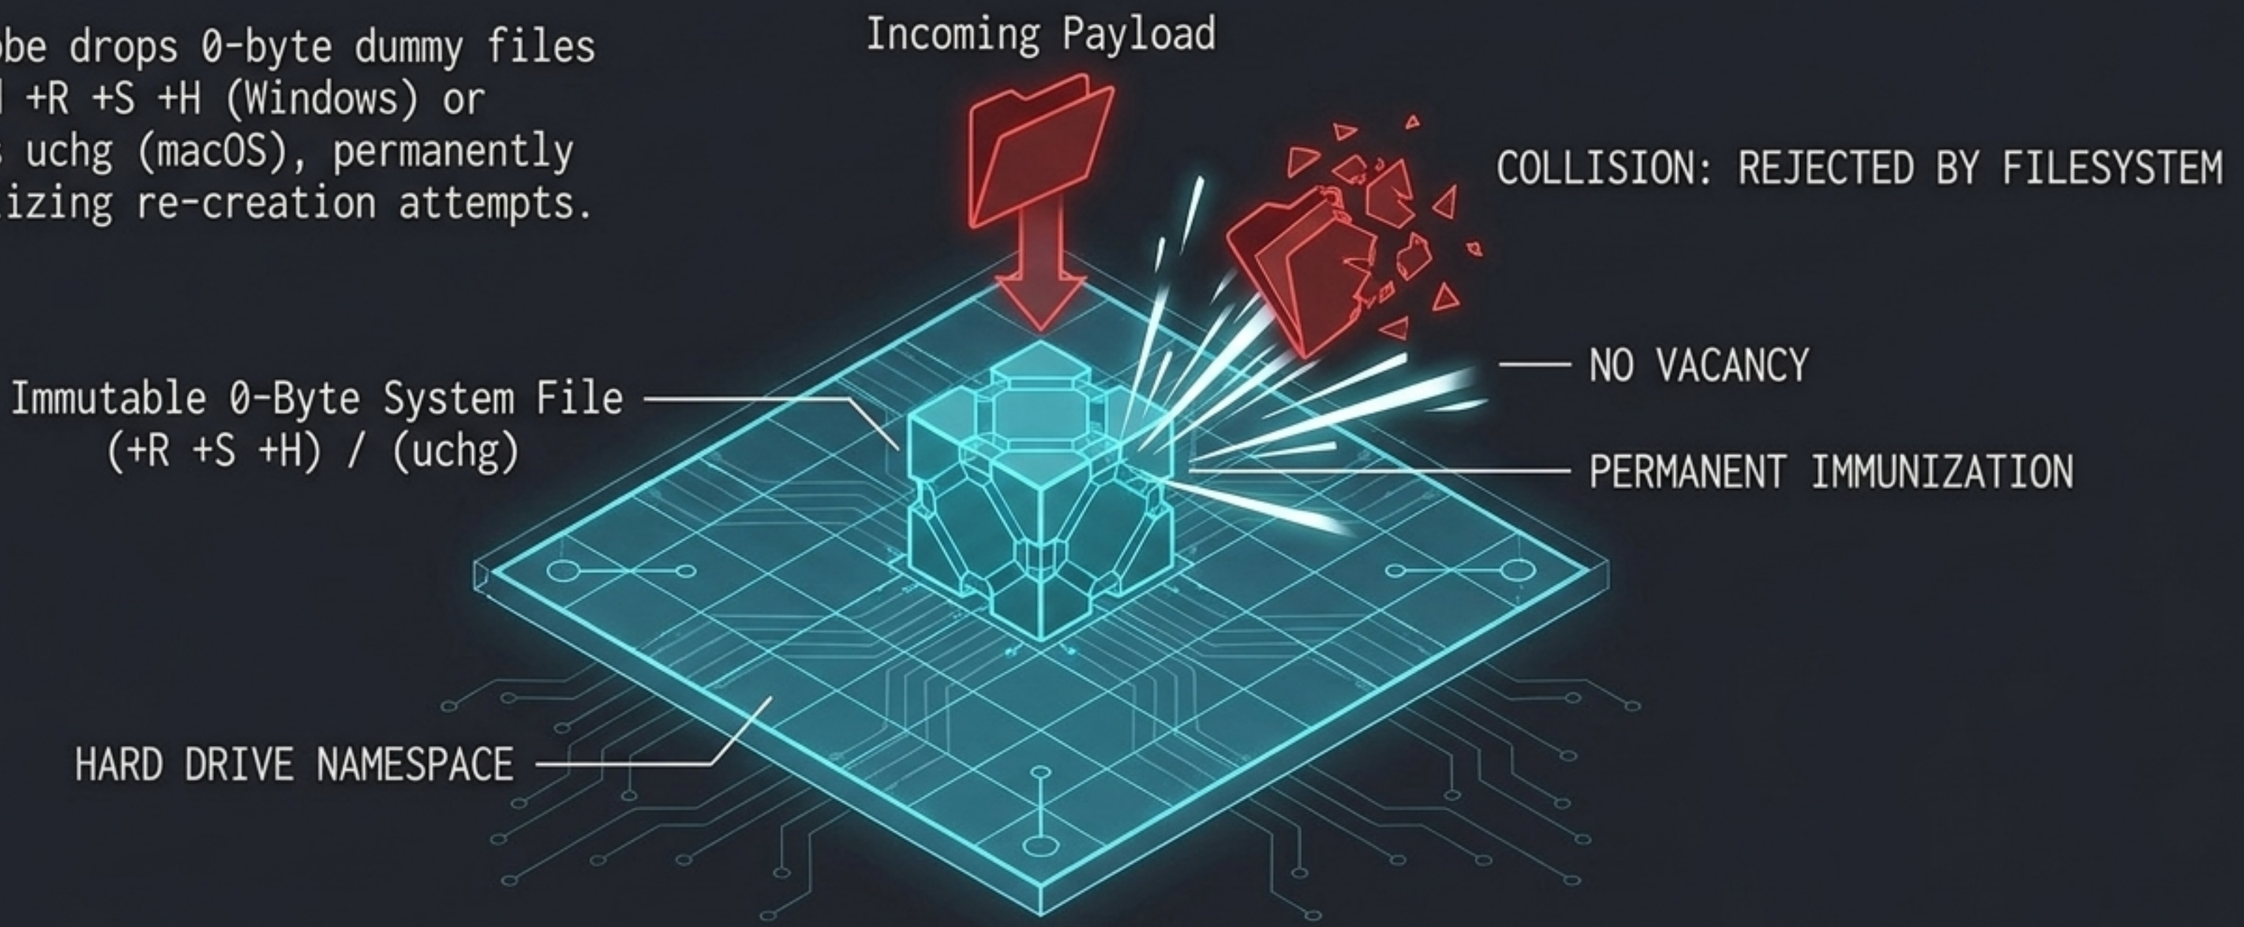

If we stop at Phase 4, the next time any vendor product is installed, the zombie loop is reintroduced. To achieve permanence, we must weaponize the core physics of the operating system against the payload.

Gemini Notebook

Phase 5: NTFS & APFS Immunization Shields

The collision-based filesystem lock. On Windows NTFS and macOS APFS, an OS cannot create a directory if an immutable system file of the identical name occupies that exact path.

NukeAdobe drops 0-byte dummy files flagged +R +S +H (Windows) or chflags uchg (macOS), permanently neutralizing re-creation attempts.

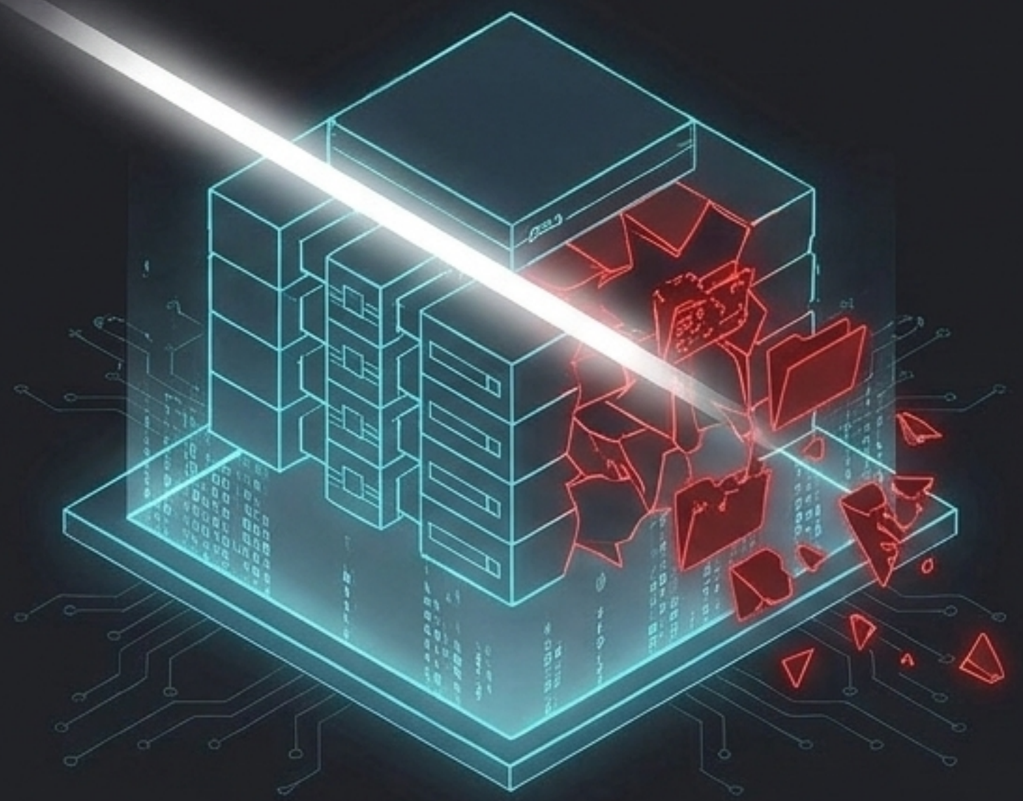

The weaponized physics of the OS filesystem ensures no re-entry.

Gemini Notebook

Phase 6: Final Flush & Verification

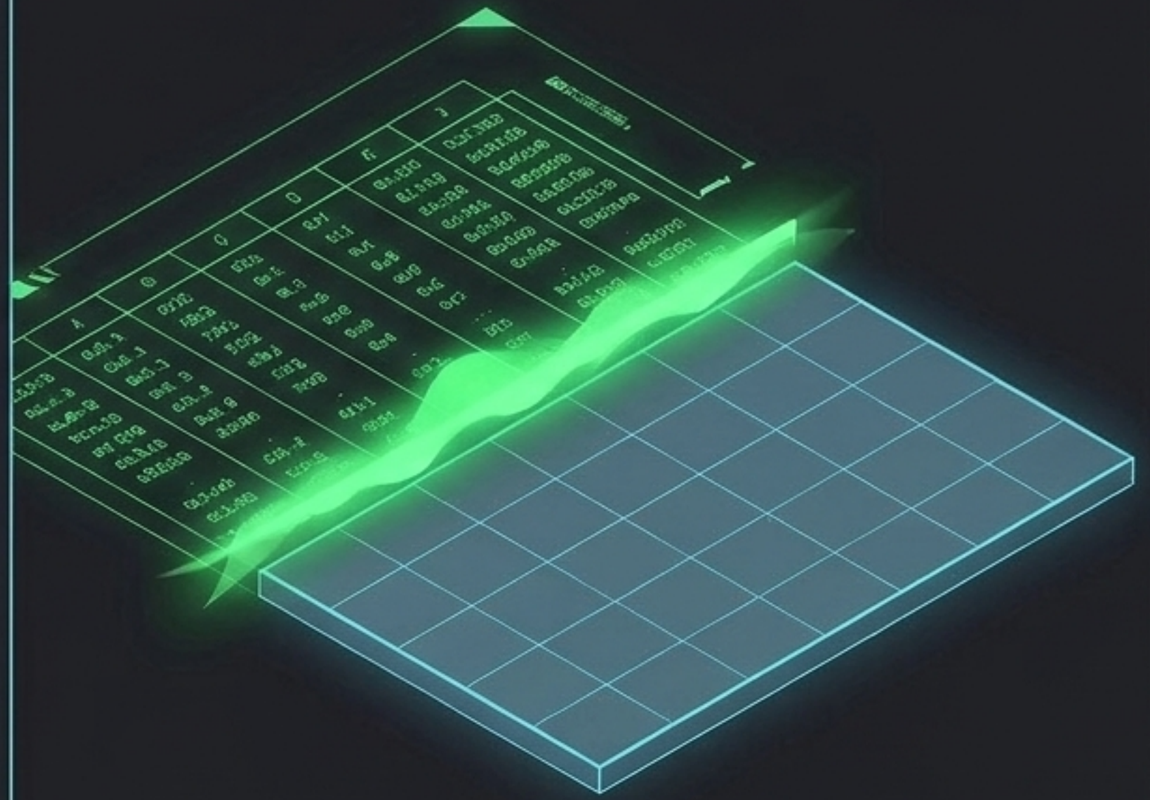

Registry Flush

Eliminates dangling Add/Remove Programs registry stubs.

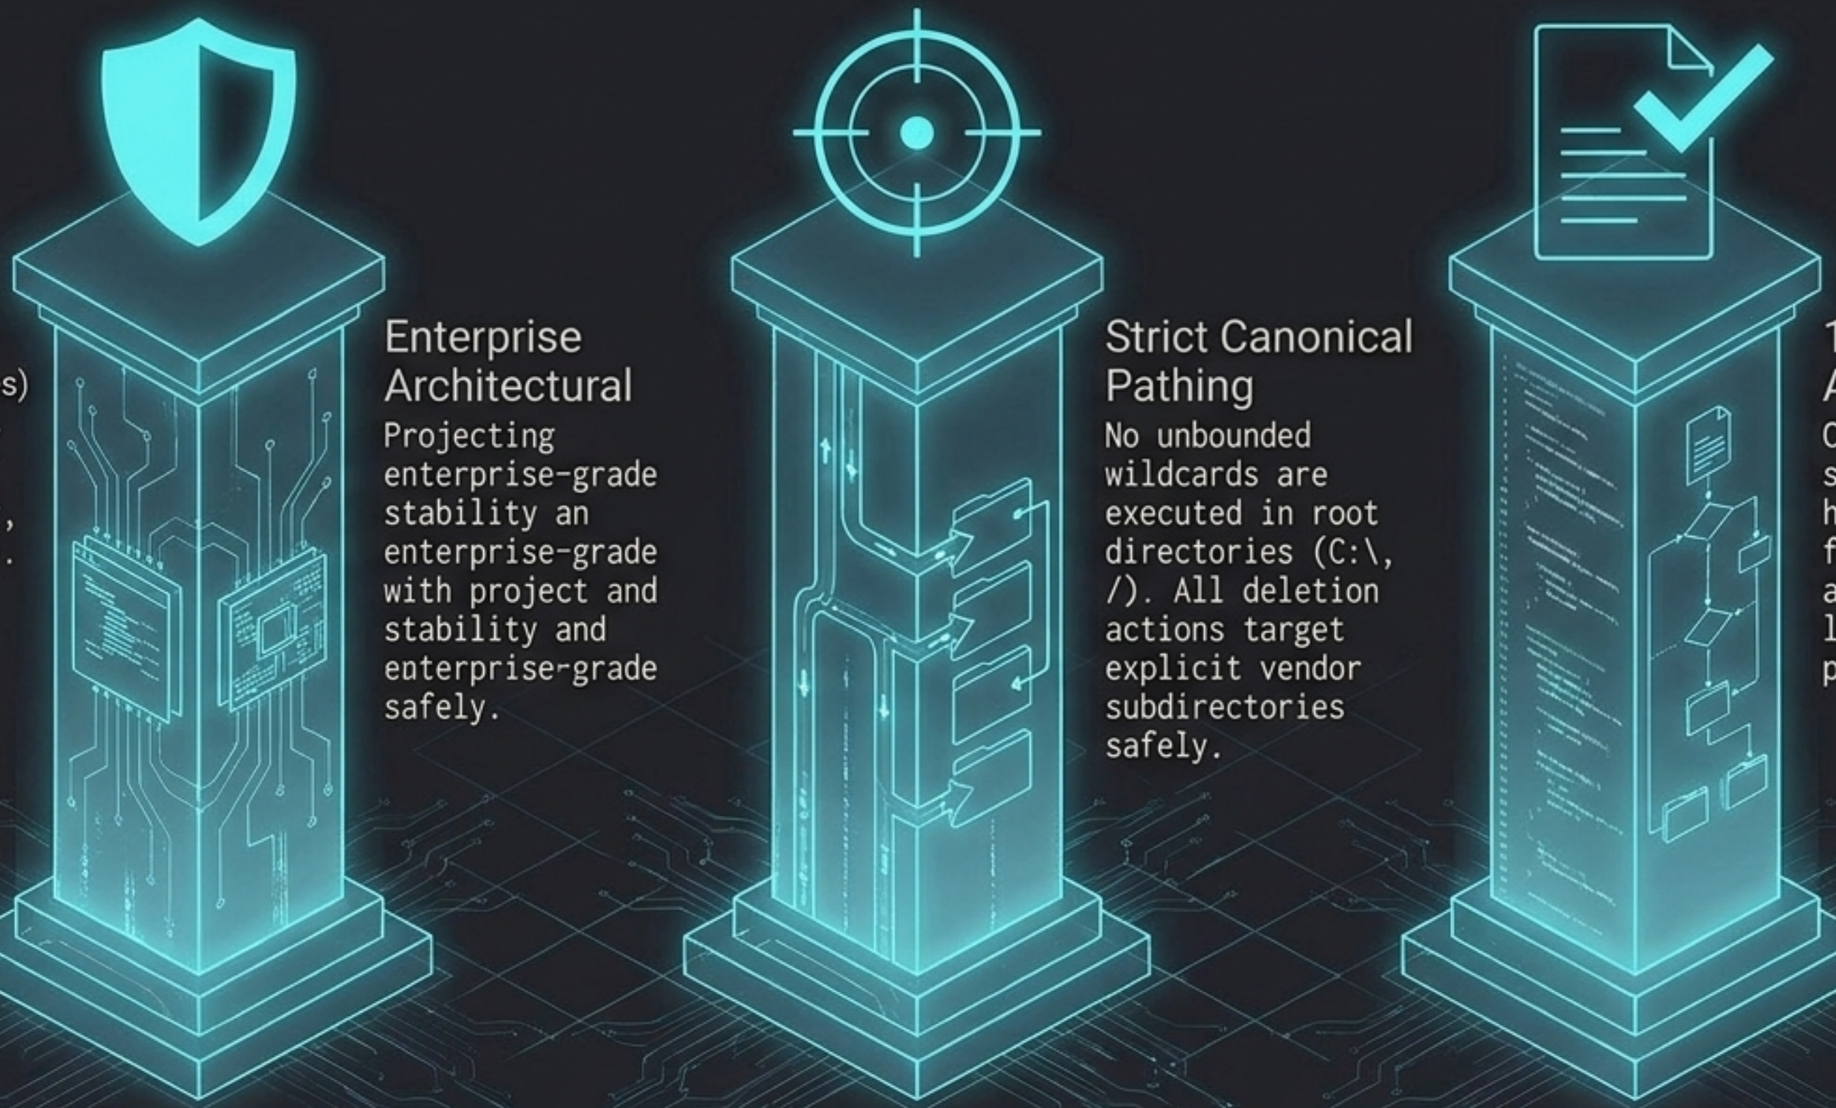

Cache Flush

Flushes system DNS resolver caches to clear out historical network routing to beaconing servers.

Gemini Notebook

Security & Safety Invariants

Native APIs
(Zero Dependencies)

Uses exclusively native OS utilities (rmdir, launchctl, etc.). No external binaries, downloads, or network calls are made.

Enterprise Architectural

Projecting enterprise-grade stability an enterprise-grade with project and stability and enterprise-grade safely.

Strict Canonical Pathing

No unbounded wildcards are executed in root directories (C:\, /). All deletion actions target explicit vendor subdirectories safely.

100% Auditability

Complete script source code is human-readable, fully documented, and under 150 lines per platform.

Gemini Notebook

Executive Summary

The Threat Neutralized

- ✓ Resurrection Loop Dismantled
- ✓ Hardware & Process Telemetry Stopped
- ✓ Dangling Registry & Caches Purged

The Solution Delivered

- ✓ Zero-Dependency Native Execution
- ✓ Cross-Platform (Windows & macOS)
- ✓ Permanent Immunization via Filesystem Locks

System Sovereignty Restored.
